HOMEWORK 4 SOLUTIONS variables X and Y are said to be independent conditionally on A is for every non-negative measurable functions f, g , we have. $E\{f(X)g(Y) | A\} = E\{f(X) | A\} \times E\{g(Y) | A\}$ a.s. Show that X, Y are independent conditionally on A is and only if for every non-negative A -measurable random variable Z , and every non-negative measurable functions f, g , we have. $E\{f(X)g(Y)Z\} = E\{f(X) \dots$

In stochastic systems, the probabilities that various states will be repeated will remain constant. See for example Linear difference equation#Conversion to homogeneous form for the derivation of the steady state. In many systems, a steady state is not achieved until some time after the system is started or initiated. This initial situation is often identified as a transient state, start-up or ...
